At the end of the nine-week Stock Challenge, my portfolio recorded a total return of -4.7%, falling short of the STI benchmark's performance of +2.89%. This 7.6% underperformance was a stark but valuable lesson in the cost of poor timing, overexposure to leverage, and inconsistent trade discipline. My final account value stood at \$95,306, reflecting a net loss of \$4,694. Rather than focusing solely on the return figure, I used this challenge to understand market behavior, refine my decision-making framework, and build habits as a more structured and self-aware trader.

One of my first trades was with DBS Group Holdings, selected as my large-cap stock. I entered at \$44.37 and exited at \$45.00, booking a small but calculated gain of 1.19%. The rationale behind this position was grounded in a top-down approach. DBS stood out in CIQ Pro's peer comparison tool, showing stronger ROE, more stable margins, and better cost-efficiency ratios than its domestic competitors OCBC and UOB. Additionally, macro data supported my trade, as Singapore's bank lending and net interest margins had been resilient despite global rate volatility. This trade reinforced the importance of fundamental support when entering relatively conservative positions. While the return was modest, DBS acted as a low-volatility anchor in my otherwise high-beta portfolio.

In contrast, my penny stock trade in ZICO Holdings revealed the dangers of trading without a clear catalyst. I purchased 10,000 shares at \$0.056 based on a pattern of historical price spikes and vague online chatter suggesting potential corporate restructuring. I failed to validate these claims with solid data or insider activity, and the price subsequently declined to \$0.041. I exited with a 37.5% loss. This trade exposed a critical flaw in my early approach—overreliance on speculative hope rather than actionable insight. I also neglected to apply stop-loss discipline or establish a predefined exit point, which could have capped my downside earlier.

I also traded a structured warrant, Alibaba MB eCW251003, as part of the requirement to explore leveraged instruments. I entered this position at \$0.226, expecting a technical bounce in Alibaba after it had formed what appeared to be a bullish reversal pattern. However, the move lacked volume confirmation and was contradicted by deteriorating sentiment across Chinese tech, triggered by tightening regulations and weak consumer confidence data. I exited at \$0.094 for a loss of 48.23%. This trade taught me that warrants are extremely sensitive to timing and sentiment. I had identified a possible technical setup but failed to consider macro headwinds and ignored clear resistance levels. The sharp loss underscored the importance of aligning short-term timing with broader market context when using leveraged products.

Another leveraged trade that resulted in a significant drawdown was my Singtel 5x Long DLC. I entered this trade at \$1.882, aiming to profit from what I thought was a base formation and mean reversion opportunity. However, the stock moved sideways with low momentum, and the DLC's time decay became increasingly punishing. I eventually sold at \$1.59 for a 20.87% loss. The experience highlighted that even if the underlying asset holds value, leveraged DLCs are unsuitable for trades without directional momentum. The structure of DLCs penalizes time spent in consolidation zones due to compounding decay, and this trade made me far more cautious about holding leveraged products overnight.

My best-performing position came later in the challenge when I bought a S&P 7x

Long DLC. This was a well-researched, event-driven trade. I timed my entry after Nvidia's earnings announcement, which beat expectations and reignited bullish sentiment across US tech indices. I also noticed a positive divergence in the RSI of the S&P 500, indicating upward pressure. I bought into the DLC and exited within two trading days with a gain of 31.37%, or \$4,474. This trade worked because I applied a proper catalyst, used technical confirmation, and adhered to my risk-reward ratio by setting an exit plan from the beginning.

By contrast, my worst trade was the Alibaba 5x Long DLC, entered on a false rebound narrative. I anticipated a short-term turnaround based on past support levels and government stimulus headlines. However, I failed to notice bearish divergence in the MACD and an overall lack of institutional inflows. The trade quickly turned against me, resulting in a \$3,720 loss. Emotionally, I hesitated to cut the position because I felt the stock "should" rebound. This mistake was rooted in bias and emotional attachment, rather than objective analysis.

The evolution of my trading strategy can be segmented into three phases. In the first three weeks, I was overly reliant on gut instinct and general news headlines, resulting in volatile and often unplanned trades. By week four, I began incorporating CIQ Pro and InvestingNote tools more rigorously, which helped me refine stock selection and trade rationale. In the final three weeks, I transitioned to a more structured approach, combining catalysts, technical signals, and market sentiment to form clearer theses. This shift not only improved my trade quality but also reduced my emotional stress. I began to appreciate that successful trading is not just about returns, but about consistency, risk control, and execution discipline.

Throughout the Stock Challenge, CIQ Pro proved to be an invaluable tool in supporting my trade decisions and helping me shift from reactive trading to a more data-driven, research-based process. Two features, in particular, played a critical role in shaping my strategies and outcomes: the Peers Comparison function and the Key Developments tab.

The Peers Comparison function allowed me to evaluate companies within the same industry using a side-by-side matrix of financial ratios and operating metrics. I found this especially useful when analyzing large-cap banks in Singapore. For example, prior to initiating my trade in DBS Group Holdings, I used this function to compare its return on equity, price-to-book ratio, and net profit margins against UOB and OCBC. DBS stood out with the highest ROE, the strongest cost-to-income ratio, and more consistent year-over-year earnings growth. This data-backed analysis gave me the confidence to allocate a larger portion of capital to DBS, knowing that it was outperforming its sector peers on multiple fronts. The tool also helped me avoid weak picks that appeared attractive on the surface but revealed operational inefficiencies or stretched valuations upon closer examination. The comparative layout, visual scoring, and customizable filters allowed me to quickly screen for strong fundamentals without manually piecing together financial statements from multiple companies. As a result, my stock selection process became faster, more accurate, and better aligned with my risk-reward preferences.

Another CIQ Pro feature that significantly influenced my trades was the Key Developments tab. This function aggregates time-sensitive and material updates related to earnings, dividends, insider transactions, and regulatory disclosures across companies. It allowed me to plan trades more strategically by identifying upcoming

events and news catalysts that could drive sentiment. For instance, I used the Key Developments tab to track Nvidia's earnings announcement in the United States, which turned out to be a critical trigger for my successful S&P 7x Long DLC trade. Anticipating a broader tech sector rally following Nvidia's earnings beat, I entered the trade with greater confidence after confirming the release date and positive reaction. Similarly, I used the tab to monitor developments related to Tencent, which influenced my decision to reduce exposure to Chinese tech counters after observing soft earnings guidance and reduced market optimism. By consolidating these developments in a structured and chronological format, the tab helped me avoid the noise of general news feeds and focus on high-impact information.

Both of these tools not only supported my individual trade decisions but also helped me develop stronger market intuition and workflow discipline. Instead of browsing general news or relying on social media signals, I developed the habit of consulting CIQ Pro as my first step before making any trade. Over time, this practice improved the quality of my trades and reduced impulsive entries. Most importantly, it instilled a professional research mindset, teaching me how real-world traders evaluate companies based on comparative strength and event sensitivity. CIQ Pro was not just a support tool for the challenge. It became my gateway to thinking like an analyst.

Among the many features offered by the InvestingNote platform, the one that had the most meaningful impact on my learning and decision-making was the Portfolio Yield versus Benchmark visual tracker. This function enabled me to compare the performance of my simulated portfolio directly against the Straits Times Index over the nine-week challenge period. What made this feature powerful was not just the comparative line chart, but how it offered me a real-time, objective mirror of my trading effectiveness. At various points in the challenge, especially during the fourth and sixth weeks, I noticed that my portfolio was underperforming the STI by a growing margin. Rather than seeing this as discouraging, I took it as a prompt to review my strategy and understand the underlying reasons for the divergence.

Upon closer reflection, the underperformance coincided with periods where I had taken on multiple high-risk trades in speculative instruments without clear catalysts. These included poorly timed entries into Chinese tech DLCs and a few penny stock positions that lacked both liquidity and news drivers. The visual gap between my portfolio and the benchmark served as a powerful wake-up call. It helped me realise that even though individual trades might have seemed justifiable at the moment, the collective outcome of those decisions was lagging behind a passive market index. This insight motivated me to reassess my approach. I reduced my position sizes, tightened my entry criteria, and began aligning trades with stronger macro themes and event-driven signals. In the following weeks, I managed to close the performance gap slightly, largely due to a more structured and disciplined execution process.

What sets this function apart from a simple performance log is the psychological accountability it builds. By displaying a constant reference point in the form of the STI, the tracker discouraged me from chasing short-term wins or trying to overcorrect after losses. Instead, it reinforced the value of consistency and capital preservation over impulsive behavior. The visual trend also gave me greater clarity on how volatility in specific trades affected my overall portfolio health, which encouraged me to adopt a more portfolio-level perspective rather than focusing solely on individual positions.

In addition to providing performance insights, the tracker also encouraged me to engage in post-trade reflection. I began reviewing my biggest gains and losses and evaluating how each trade contributed to my performance relative to the benchmark. Over time, I started to spot behavioral patterns, such as overtrading after a loss or holding onto positions too long due to emotional attachment. Identifying these habits was a major step forward in becoming a more self-aware trader.

Overall, the Portfolio Yield versus Benchmark function did more than just chart performance. It helped cultivate analytical maturity, build emotional discipline, and promote a broader perspective on capital allocation. It was a constant reminder that trading success is not defined by isolated wins but by sustained, measured outcomes that can consistently outperform a benchmark over time. In this sense, it served as both a technical and psychological feedback loop that elevated my learning throughout the challenge.

Participating in the Stock Challenge was a transformative experience that challenged me not only intellectually, but also emotionally and strategically. One of the earliest and most important lessons I learned was the critical role of emotional discipline in trading. In the initial weeks, I frequently found myself holding onto losing positions far longer than I should have, driven more by hope than logic. A clear example was my trade in the Alibaba 5x Long DLC, where I entered prematurely based on speculative sentiment and failed to cut losses even after clear technical breakdowns. I had formed a narrative in my head that the stock was due for a rebound, and instead of relying on price confirmation or risk signals, I clung to that belief. This experience taught me that discipline is not just about when to buy, but knowing exactly when and why to exit. Letting go of emotional bias is essential for capital preservation and long-term growth.

Another important learning point was my evolving understanding of leveraged financial instruments, particularly DLCs and structured warrants. Initially, I approached these products with enthusiasm due to their potential for outsized returns. However, after experiencing significant losses from time decay and misjudged timing, I began to realise how unforgiving these instruments can be without precise execution. In the case of my Singtel 5x Long DLC, the underlying stock moved sideways, yet the position suffered steep decay-related losses over just a few sessions. This clarified for me that leveraged instruments are not just amplified versions of regular stocks. They are structured to reward only short-term, directional conviction with strict timing. I began to adopt a more disciplined approach by entering these trades only when supported by catalysts such as earnings announcements or macro tailwinds, and I kept tighter stop-loss levels to minimise downside.

Midway through the challenge, I encountered an unexpected disruption that further shaped my perspective on trade management. I was away for about two weeks during the school holidays, during which I was unable to monitor my portfolio or react to market changes. One of my positions, which had been in profit prior to my break, reversed sharply during that period. By the time I returned, I had missed the opportunity to lock in gains, and the position ultimately ended in a loss. This experience was a turning point. It made me realise that trading requires not only planning while active but also preparing for periods of inactivity. I began to appreciate the importance of setting protective measures such as stop-loss orders and alerts in advance, especially for volatile or leveraged products. Going forward, I know I must treat even short absences as risk events and adjust my positions accordingly to

protect capital.

The challenge also pushed me to develop deeper research habits and adopt a more structured decision-making process. Initially, many of my trades were reactive, driven by market chatter or general trends. Over time, however, I began relying more heavily on tools like CIQ Pro and InvestingNote to guide my thinking. The Peers Comparison function helped me identify fundamentally stronger companies like DBS, while the Corporate Announcements Tracker enabled me to anticipate market reactions to news events. These tools gave me an analytical edge and allowed me to build higher-quality trading theses. As my confidence in the data grew, so did my ability to enter and exit trades with more clarity and less hesitation. I also started tracking the outcomes of each trade more systematically, identifying recurring patterns in both my successes and failures.

Most importantly, this Stock Challenge accelerated my growth as a self-directed learner. The requirement to trade a range of financial instruments, including structured warrants and DLCs, which were not yet covered in class, forced me to take initiative in understanding their mechanics and risks. I watched webinars, read technical guides, and experimented with different indicators. This independent learning process was not just about absorbing facts, but about testing concepts in real time and seeing their consequences play out. The process helped me move beyond passive learning and into a mindset of active experimentation and reflection.

By the end of the challenge, I no longer saw trading as a series of isolated bets, but as a system that requires preparation, adaptability, and continuous learning. I developed a much stronger appreciation for risk-reward trade-offs, the importance of aligning strategies with market conditions, and the discipline required to avoid emotional pitfalls. The mistakes I made early on became catalysts for personal growth, and the habits I formed, such as using performance benchmarking, pre-trade planning, and post-trade reviews, will stay with me as I continue my investing journey. This challenge was more than an academic requirement. It was a practical test of resilience, critical thinking, and maturity in decision-making. I leave it not just with experience, but with a clearer identity as a thoughtful and self-aware investor.
